

## **RSSAC Statement at the ICANN Accountability Town Hall**

Internet Governance Forum | 2 September 2014 | Istanbul, Turkey

---

“Throughout ICANN’s history, the RSSAC has discussed the role and responsibility of the root server operations from the three major aspects. Technical stability and availability for the reliable services of the DNS is the most important aspect. The global distribution of services, to achieve the root server’s responsibility for the growing coverage of the Internet, thus is also very important. The strong network among the operators and the community supports and understandings to the root servers and the RSSAC are the keys for this model of diversified distributed systems.

The most important contribution of the Internet to human history is its single truly global name space. Therefore, ICANN’s overriding accountability is to ensure that vision of the Internet: One World, One Internet, One Name Space.”
