

Process to update the RDAP profile in a policy implementation project

Registrars and gTLD registry operators are required to provide registration data directory services over Registration Data Access Protocol (RDAP). Current and future policy implementation may include a track of work to update the gTLD RDAP profile (RDAP Profile), when applicable, as part of the deliverables of the policy implementation. The RDAP Profile aims to provide technical instructions to gTLD registries and registrars on how to implement an RDAP service in a consistent way and in accordance with contractual and Consensus Policy requirements.

The following process flow describes how ICANN org intends to work with the IRT and relevant experts in the community to update the gTLD RDAP Profile in the context of a policy implementation.
